

ICE-TAMP User Demo Guide

Overview

This guide provides a brief walkthrough of the main features available to each user role in the TAMP application. It is intended for demonstrations and user acceptance testing.

Getting Started

1. Install project dependencies:

`npm install`

2. Start the application:

`npm run dev`

3. Open the application using the URL displayed in the terminal (typically `http://localhost:5173`).
4. Register or log in with the appropriate user role.

Freight Owner

Purpose: Manage freight loads and shipments.

Key Activities

- Register or log in as a Freight Owner.
- Create, edit, and delete freight loads.
- View available transport requests.
- Accept or reject transporter requests.
- Track shipment progress.
- Confirm completed deliveries.
- Submit ratings for completed shipments.

Transporter

Purpose: Manage trucks and transport freight.

Key Activities

- Register or log in as a Transporter.
- Register and manage truck information.
- Browse available freight loads.
- Submit requests for suitable loads.
- View assigned shipments.
- Update delivery progress.
- Rate completed deliveries.

Administrator

Purpose: Monitor and manage platform activities.

Key Activities

- Log in as an Administrator.
- View platform statistics and dashboard information.
- Manage user accounts.
- Review and resolve disputes.
- Process verification requests.
- View audit logs.
- Configure application settings.

Demo Tips

- Create separate accounts for each user role before demonstrating the system.
- Follow the workflows in the order: **Freight Owner → Transporter → Administrator**.
- Use a fresh browser session or clear Local Storage before each demonstration.
- Highlight the interaction between user roles, such as load requests, shipment creation, and ratings.

Summary

The TAMP demo showcases three role-based workflows within a single logistics platform. Freight Owners manage freight loads and shipments, Transporters register trucks and fulfil delivery requests, while Administrators oversee users, disputes, and system management. The application is a frontend prototype that stores data in browser Local Storage, making it suitable for demonstrating functionality without requiring a backend server.
